This world is in
your hands

your space

Receive live, on-screen clinical expert support and training

Get live application support from a clinical expert over the phone and through your equipment console or Advantage Workstations. Our remote experts can help solve procedural or processing issues in real time—as you encounter them. No more distance: these clinical experts see exactly what you see on your screen and can even “take your hand” to personally show you how to navigate the imaging system faster and more efficiently. Together, you will discover a new space of knowledge—your space.

your way

Be confident in managing sophisticated scanning technologies

GE Healthcare is known for its dedication to troubleshooting services. AppsLinq is no exception: our clinical experts provide first-class training and support services. AppsLinq support is available at any point during an examination of a patient, whether it is a familiar procedure that you want to optimise or a new procedure for which you need the guidance of an expert. AppsLinq was developed for you—to help improve your skills and allow you to handle whatever comes your way.

It is meant for you—to be empowered

UK

your time

Schedule learning sessions at the most convenient times

With AppsLinq, you also get training lessons on your own terms.

You may want to start by practising your routine, with real-time feedback. Or jump to the next level, adding new diagnostic skills to your range of expertise, with on-screen intensive coaching from our remote specialists—individually or in small groups. With proper guidance and the right protocols regularly updated, you may quickly be confident enough to practise these new techniques and procedures you thought were out of your reach.

And not only will AppsLinq help improve your performance level, it can also help reduce scan time.

You. empowered

Reduce scan time, optimise protocol use—with high quality imagery

Early adopters of the AppsLinq program report acquiring more diagnostic data with reduced exam times, which translates into increased productivity and clinical excellence. This means more appointments available to service a greater number of patients without any change in operations.
